

## The UFS Offers Safe & Secure Fueling for Many Applications

Spring 2019

The Universal Fueling System (UFS) is equipped with High-LINK® technology and allows for safe and secure fueling in many fuel dispensing applications.

Highland Tank's Universal Fueling System (UFS), equipped with High-LINK® technology, is engineered for remote fuel dispensing in challenging environments. The UFS provides a means for safe, secure and reliable fuel management in an efficient, scalable package.

The primary off-grid power source provides for level monitoring and transaction storage even if communication is interrupted. High-LINK® automatically syncs data when communication is restored.

High-LINK® technology, coupled with the UFS can be a valuable asset in situations where remote fueling or fueling without a reliable power source is necessary. This tank and fueling system are ideal for disaster relief, agriculture, remote construction or transportation sites, and temporary job sites.

While our double-wall skid tanks are ideal to couple with the UFS, Highland Tank can configure a wide variety of steel storage tanks to suit the needs of your remote or mobile location. Cylindrical, rectangular, and vertical designs are available ranging from 185 to 15,000 gallons. Larger capacity systems can be designed and customized to your needs upon request.
