TANKS PLAY A VITAL ROLE AT MISSION CRITICAL FACILITIES

Highland Tank recently fabricated and shipped three 20,000 gallon UL-2085 Fireguard® tanks to be used for storing #3 diesel fuel for five large backup power generators at a mission critical facility.

This new dedicated fuel system was installed at a Central Energy Plant at a hospital. The upgrade to the Central Energy Plant included the replacement of two generators, one chiller with pumps, electrical upgrades, and a fuel system.

The tanks are accompanied by a custom-designed aluminum catwalk also fabricated by Highland Tank. The catwalk has a removable section for the addition of a 4th 20,000 gallon Fireguard® tank and additional generators to be added in 2020/2021.

Highland Tank supplies a variety of tanks for mission critical facilities. Thermal energy storage tanks are used for cooling purposes at data centers, backup diesel storage tanks are used for power generators at hospitals, data centers, and military bases, and water storage tanks can be used in HVAC operations and other critical operations at healthcare facilities.

Mission critical facilities require highly resilient infrastructure to ensure uninterrupted vital services that enable the facility to function efficiently, effectively, and continuously. These facilities require 24/7 operation.

Contact Highland Tank to learn more about how we can help by providing high-quality tanks for mission critical infrastructure.
