### COMPLETE PACKAGES FOR SECURE AND EFFICIENT FUELING

Highland Tank's Turnkey Fuel Dispensing Systems include all of the components necessary to fuel an entire fleet from your private facility, including the High-LINK FuelShield Plus for fuel management and level monitoring together in one system.

Highland Tank has carefully crafted nine prepackaged fuel systems to suit the needs of any size fueling operation. Every system is designed to be delivered completely assembled to the site, including all plumbing, wiring, and accessory mounting. Every one of our designs incorporates High-LINK integrated systems for a truly complete fuel dispensing system.

The 12,000-gallon Highland Tank Fireguard shown here was recently delivered to a large food processing facility to fuel the company's own truck fleet and will fuel 25-30 full-size semi-trucks with on-road diesel. The SK-107 turnkey package installed on both heads of the tank allows two full-size semi-trucks with trailers to pull up along each side of the tank and fuel at the same time.

The SK-107 package utilizes suction pumps for increased pumping power and increased safety measures during regular pump maintenance.

With a 23GPM flow rate, these drivers will spend less time fueling and more time delivering food across the United States. Each end works independently so that if one pump is down for maintenance, the site can still fuel from the other end of the tank.

High-LINK FuelShield systems to protect the site and monitor levels to prevent theft, fraudulent activity, and give the site manager peace of mind. The High-LINK software application allows the site managers to easily run transaction reports, reconcile fuel costs and fuel use, and monitor inventory to easily schedule fuel deliveries and verify the vendor's delivery bill.

The company decided to utilize Highland Tank's manufacturing capacity and design to build their fuel system because of the convenience of a one-stop-shop purchasing process to handle their fuel island. In doing so, we assisted the customer in creating a design that will suit their needs.

We also made the installation process easy by having a pre-designed and prepackaged system. The customer only needed to provide their electrical needs to enable power to the tank. Once on site, the fueling system was essentially plug-and-play, allowing for speedy site progress and reducing the amount of on-site labor needed.

Highland Tank also provides support and training for the fuel dispensing systems and software. The customer can make one phone call to get easy answers as questions arise.
