### A VERSATILE & SAFE FUEL STORAGE SOLUTION

Highland Tank strives to meet the need for custom-designed storage tanks with unparalleled engineering and technology. We also engineer our products to meet our customers' needs. Our UL-2085 labeled Fireguard® tanks provide the most secure fuel storage. Fireguards are aboveground thermally protected, double-wall steel storage tanks used for the safe storage of motor fuels and other flammable and combustible liquids.

These tanks have passed ballistics, impact, two-hour pool fire, and hose stream tests. With these safety features, setback limitations are reduced by up to 50%.

In addition to the safety features of the Fireguard, our made-to-order tanks provide solutions for unique applications.

One example of a custom Fireguard was for a fueling project at a marina site. The customer required a 12,000 gallon compartmented Fireguard tank as part of a fuel tank replacement project. The tank was split into 9,000 gallon and 3,000 gallon sections and was equipped with piping, fill boxes, and ladders. It will be used for fueling boats at a marina.

While the Fireguard gives protection to the contents inside the tank, the exterior is protected by an extremely durable coating. The coating we used in this application is a two-part system. A zinc primer is applied first to combat the salt water environment. Then we add a high-solids polyurethane top coat formulated to hold up to direct sunlight and resist chemicals and corrosion.
