Highland Tank is proud to offer a new factory tour video featuring our oil/water separators.

Highland Tank provides the strongest and most reliable oil/water separators in the industry. Our separators are designed to remove oil, grease, light petroleum products, and oily-coated solids from a variety of wastewater discharges to comply with EPA discharge regulations.

In the video, we show different configurations of oil/water separators, each designed for a different application.

Oil/water separator configurations:

Series G: Features an integral pre-settling chamber to intercept solids and grit.

Series J: Features an integral effluent chamber for pump-out.

Series S: Features an integral side oil chamber for storing separated oils.

Series TF: Features a separate chamber with a proprietary trickle filter media.

Our oil/water separators are in use all over the world. Industrial facilities, power plants, landfills and garbage facilities, and transportation facilities are just some of the places we see oil/water separators making a big impact. Contact us to learn more.
