REDUCING MAINTENANCE FEES WITH AUTOMATIC GREASE INTERCEPTORS

Highland Tank offers the industry's widest selection of grease interceptors for interior, exterior, aboveground, or buried applications. We are the leaders in automatic grease removal devices offering sizes from 15 GPM through 800 GPM for point-of-use or centralized applications.

All grease interceptors should be cleaned when they reach 25% of the capacity to operate efficiently. Depending on the size and location of the grease interceptor, maintaining an efficient grease interceptor can become costly.

On average, the cost to pump out a point-of-use grease interceptor is \$250.00 (This varies depending on fuel cost, location, etc.). If the food service establishment (FSE) had their interceptor cleaned upon 25% accumulation, approximately once a month (this could be sooner based on best management practices), this would result in \$3,000.00 annual maintenance fees (minimum) for the life of the facility. That's \$30,000.00 over a 10-year period.

Automatic grease interceptors are designed to reduce those fees by skimming grease into the adjacent grease storage container on a daily basis.

The grease can then either be poured or pumped to a larger grease storage container (55 gallon drum), reducing frequency of service provider.

Much like most kitchen equipment, the Highland Tank AGI's are constructed on 304 stainless steel, durable and long lasting. Please contact Highland Tank to discuss your grease needs.

Call 814-893-5701 today or visit us at www.highlandtank.com for more information on grease interceptors.
