NEW VIDEO ON RAINWATER HARVESTING SYSTEMS

Highland Tank's High-DRO® Rainwater Harvesting Systems collect, store, and reuse rainwater.

These turnkey systems produce a sustainable and reliable alternative water source and help reduce stormwater runoff. Our rainwater systems are suitable for many residential, commercial, and industrial buildings and can be integrated in new building design or retrofitted to existing buildings.

The collected water can be used for toilet flushing, irrigation, laundry washing, cooling towers, fire water supply, power washing, industrial processing, and pool or pond filling along with other applications.

The benefits of a rainwater system include cost savings, reduced municipal water demand, reduced flooding and erosion from storms, and protected integrity of local waterways.

To learn more about Highland Tank's rainwater harvesting systems, check out our new video linked above. This video shows all the components of the system and how it operates. Contact us for more information.
