### AUTOMATIC GREASE INTERCEPTORS FOR NEW AIRPORT TERMINAL

Air travel demand is increasing along with the number of flights offered by the airlines. As the demand to fly continues to surge, many airports across the country are undergoing major transformations. Terminal expansions and other airport improvements are taking place nationwide.

One such airport is currently undergoing redevelopment that will include a new terminal featuring a variety of amenities including dining, retail, and indoor green space. Highland Tank has landed a spot in the project by supplying several grease interceptors and rainwater harvesting systems.

The grease interceptors for the project included an array of automatic units – five AGI-400s, three AGI-800s, three AGI-250 flush-with-floor units, and one AGI-250. These units will serve the restaurants and eateries in the new terminal. The AGIs are designed to reduce costly maintenance fees by skimming grease into adjacent storage tanks on a daily basis, increasing operating efficiency.

Highland Tank offers multiple levels of support on airport projects by supplying fuel tanks, oil/water separators, grease interceptors, fire protection tanks, stormwater management, and more.

Example of an AGI-800
