OIL/SAND INTERCEPTOR DESIGN QUESTIONNAIRE

Highland Tank's oil/sand interceptors are designed to intercept and collect sand, grit, grease, and free oil (hydrocarbons and other petroleum products) from storm water runoff, spills, and vehicle maintenance operations. They are offered in single, double and triple basin configurations. Interceptors can be used in conjunction with high-performance oil/water separators.

For additional options that may benefit or be required for your oil/sand interceptor, please complete our Design Questionnaire.

Depending on regulations and the AHJ (Authority Having Jurisdiction) double or triple basin interceptors may be connected directly to a sanitary sewer system or used in conjunction with a recycle wash water system. Oil/sand interceptor sizing and construction conforms to plumbing codes and municipal industrial sewer pretreatment regulations.
